No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                 g
                                                                (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinaee. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil 4732114 [gb] AFL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

BI465330 41 bp mRNA linear EST 21-AUG-2001 603206653F1 NIH_MGC_97 Homo sapiens cDNA clone IMAGE:5272405 5',
); Oligo-dT primed using primer 5'-TTTTTTTTTTTTTTTTVN-3', size-selected for average insert size 2.2 kb and normalized to ROT 5. This is a primary library enriched for full-length clones and constructed using the Cap-trapper method (Carninci, in preparation). Library constructed by M. Brownstein (NIMH/NHGRI, National Institutes of Health). Note: this is a NIH_MGC Library."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 4, Application US/10330872A

Sequence 4, Application US/10330872A

SEQUENCE 4, Application

APPLICANT: Geron Corporation

APPLICANT: Weinrich, Societ

APPLICANT: Meinrich, Societ

APPLICANT: Altimeon III, Edward

APPLICANT: Lichteteiner, Serge

APPLICANT: Lichteteiner, Serge

APPLICANT: Druzan, Ronald

TITLE OF INVENTION: Unible Drift

TITLE OF INVENTION: Unible Brite

TITLE OF INVENTION NUMBER: US/10/330,872A

CURRENT APPLICATION NUMBER: US/10/330,872A

CURRENT APPLICATION NUMBER: 08/510,736

PRIOR PELING DATE: 1999-08-04

PRIOR FILING DATE: 1999-04-04

PRIOR FILING DATE: 1999-10-18

PRIOR APPLICATION NUMBER: 09/420,056

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 368,

```
Sequences shown in AAV41169 to AAV41181 represent antisense
CC oligonuclectides to the RNA component of human telomerase (hTR). These
CC antisense oligonuclectides specifically hybridise to a nucleotide
CC sequence within an accessible region of the hTR, but that does not
CC hybridise to a sequence within the template region of hTR. These
CC oligonuclectides may specifically be used for detection of an RNA
CC component of human telomerase in a sample. This is useful for diagnosing
CC cancer (especially neuroblastoma, bladder, colon and prostate cancer),
CC and providing prognosis for a cancer patient. The inhibitory
CC oligonuclectides can inhibit the telomerase activity level in a cell by
CC oligonuclectides can inhibit the telomerase activity level in a cell by
CC oligonuclectides can inhibit the telomerase activity level in a cell by
CC oligonuclectides can inhibit the telomerase activity level in a cell by
CC of the RNA component into the telomerase activity in both cultured cells and in
CC of the RNA component into the telomerase activity in both cultured cells and in
CC cells in vivo. They can be used in therapeutics for treating or
CC immunosuppression, and for selectively down-regulating specific branches
CC of the immune system, e.g. a specific subset of T-cells in
CC cells in vivo. They can be used for treating or proventing cancer, for contraception or sterilisation, for
CC immunosuppression, and for selectively down-regulating specific branches
CC of the immune system, e.g. a specific subset of T-cells in
CC cells in cell the provention of the specific branches
CC of the immune system, e.g. a specific subset of T-cells in
CC cells in cell the provention of the specific branches
CC cell the specific subset of C-cells and in
CC cells in cell the provention of the specific branches
CC cells in cell the provention of the specific branches
CC cells in cell the provention of the specific branches
CC cells in cell the provention of the specific branches
CC cells in cell the provention of the specific branc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

telomerase RNA (TR) component genes. The TR gene promoter can be linked CC to a heterologous gene, especially a gene encoding a cytotoxin, for CC thrapy of cancer, especially neoplasias. The telomerase is necessary for CC the unrestricted proliferative capacity of many human cancers. Mutation CC or dysregulation of the telomerase repression pathway may cause reactivation or upregulation of telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription CC from the TR gene promoter through interaction of the 5' regulatory CC sequences. These substances, e.g. antisense oligonucleotides, transcription factors, peptide nucleic acids and factors that disrupt CC transcription factors, peptide nucleic acids and factors that disrupt CC signal transduction, are useful for cancer therapy. In particular, gene CC therapy vectors (especially pCTG2-codaupp) comprising the promoter and a CC viral thymidine kinase gene can be used to convert a prodrug, e.g. CC gancyclovir, so that neoplasia can be controlled or treated. Direct CC down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning transcription factors may be effective anticancer therapeutic molecules which modulate hTR promoter activity. Sequences AAC0762-80 represents CC PCR primers for amplifying human TR gene (hTR) promoter sequence.

The methods involve the use of several sequential steps, including the use of two matrixes that bind molecules bearing negative charges, a matrix that binds molecules bearing positive charges, an affinity purification step and a size separation. Telomerase is a particular target of anticancer therapies, and is useful in assays for characterizing (pre) cancerous cells. Telomerase can also be used to screen for specific modulators, for biochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them,
This invention describes a novel composition comprising human telomerase having at least 2000-fold (preferably at least 60000-fold) increased relative purity compared with crude extract of cells from
